Podium Integration - Setup Instruction

The Podium integration replaces the Twillio …

Phase 1: Podium integration app configuration

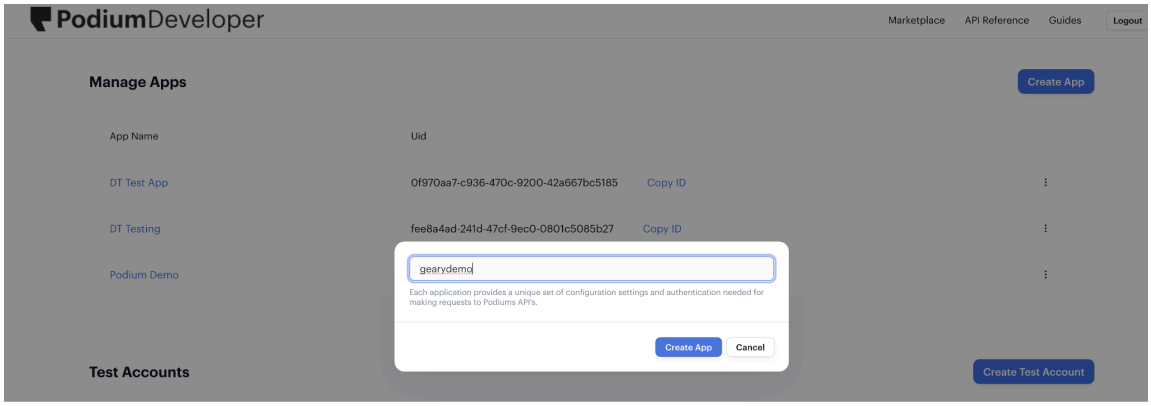
1. Sign into Podium dev portal

   Dev Portal:

   https://developer.podium.com/

   geary@dispatchtrack.com /

2. Go to dashboard: https://developer.podium.com/dashboard
3. “Create App”
4. Enter business code (activation code) as app name



5. Set OAuth Redirect URL :

   When Podium is enabled, Admin > Communication Setup > Oauth URL

   Update the same URL

   - Example:

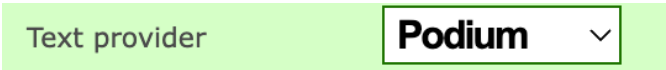
     https://dtdapiuat.dispatchtrack.com/oauth_integrations/podium_get_token

6. Set the following Scopes:
   - Read locations
   - Write messages
   - Read messages

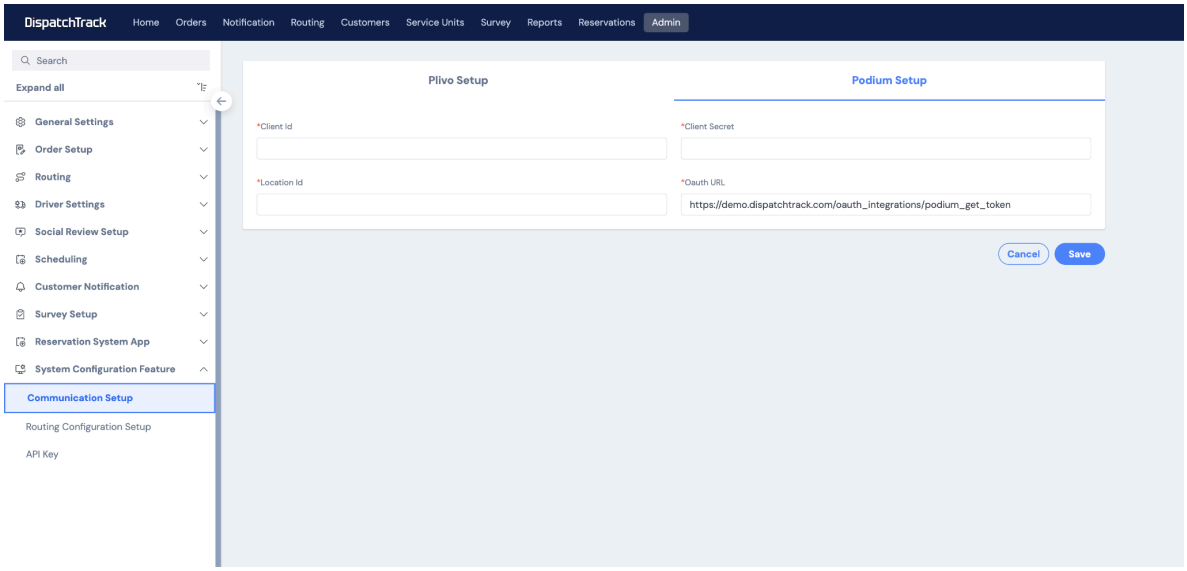
    - Read organizations
7. Save
8. Copy client id and client secret for use in phase 2 below

Phase 2: DT Admin Config

1. In Super Admin set the text provider to Podium. This will enable the Communication Setup / Podium Setup in step 2 below.



2. Under Admin / Communication Setup, select Podium Setup tab and set the following:
    a. Client id - From Phase 1, step 8 above
    b. Client Secret: From Phase 1, step 8 above
    c. Location Id: Podium locationUid to use as default if no store match found. (See store setup below)
    d. Oauth URL: Only update the subdomain to match the subdomain the customer uses



Phase 3: Store Setup

Podium typically has a separate SMS phone number for each physical store location. Typically the same land-line number used for voice calls to the store. When the store's customers are interacting through SMS pre-sales they are texting their local store's published phone number. This wall caller id will help identify the sender.

The notifications from DispatchTrack to customers though Podium should come from the same store phone number. To support this DT needs to know which store an order is associated with and what the Podium identifier for that store is.

This phase requires the Podium or the customer's participation.

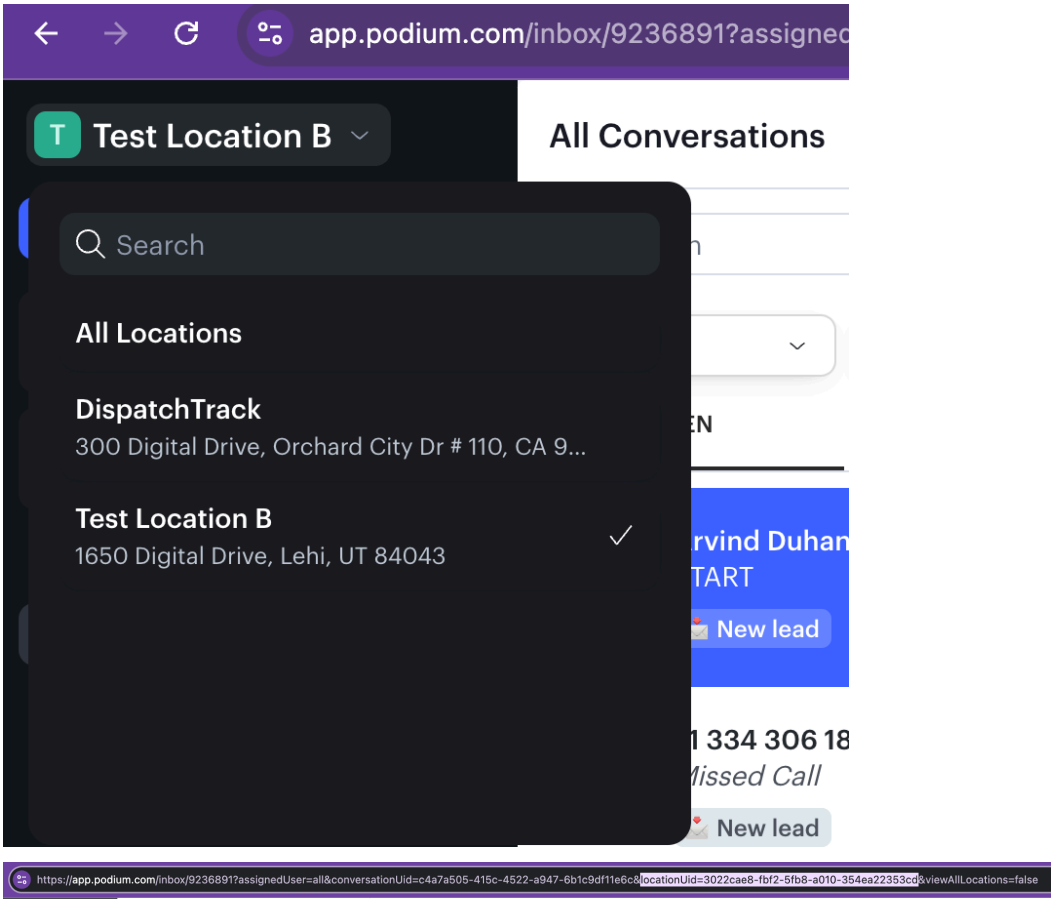
Step 1: Get a list of Podium Location Ids (AKA LocationUid)

Via Podium:

- I spoke with Leo at Podium. He suggested that his support team could send a csv file that had location name, address, and LocationUid.

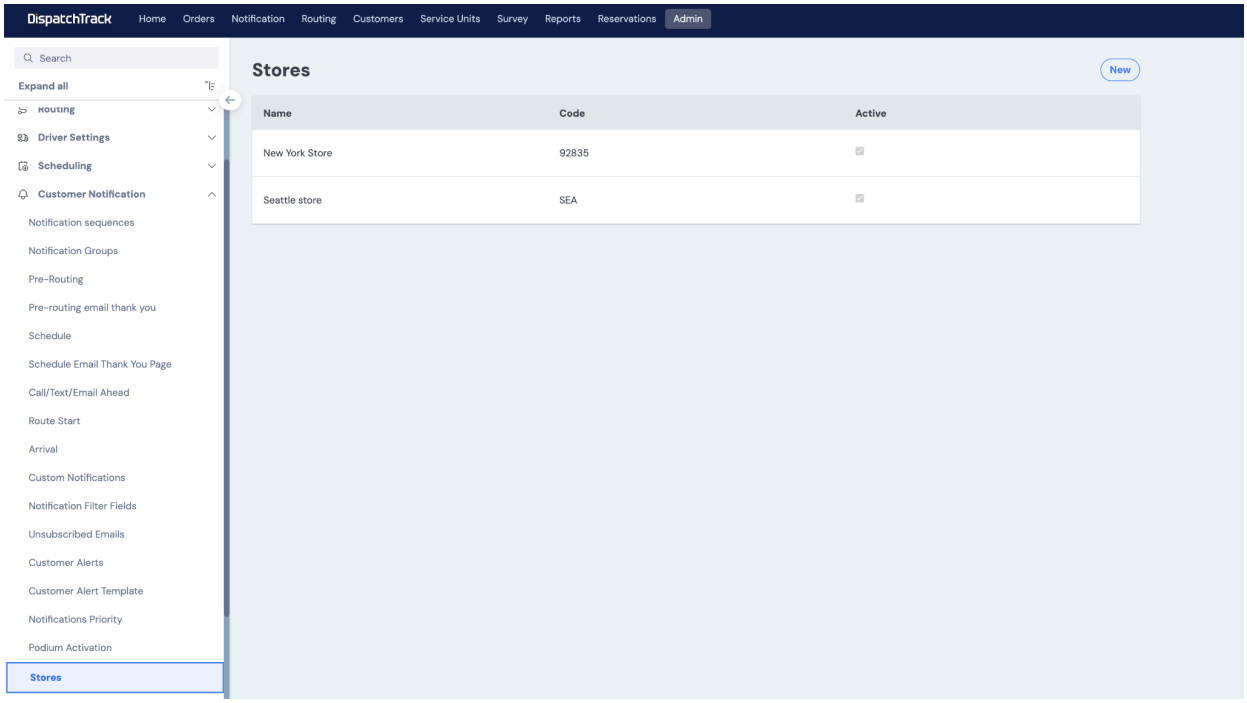
Via Customer:

- For customers with only a few locations they can get the LocationUid for each of their locations from the Podium web app.
    - Login to app.poindium.com
    - At the top left of the page is a location picker. Use it to choose a location.
    - For each location, get the LocationUid from the URL after choosing the location with the picker.

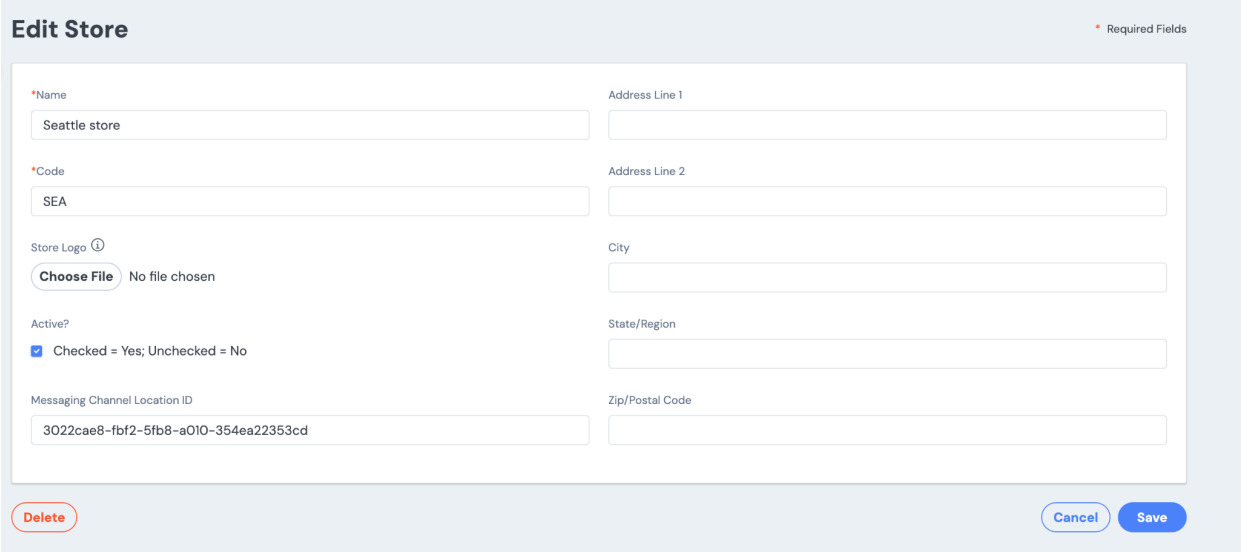


Step 2: Add Stores with IDs in DT Admin

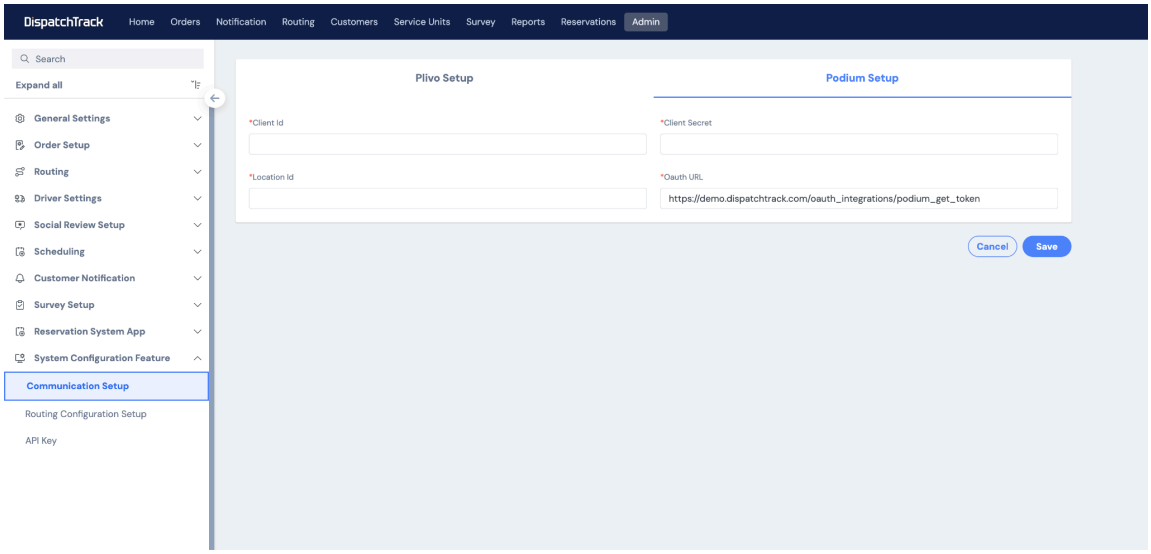
a. Navigate to Admin / Customer Notifications / Stores (If the customer has Social Review enabled find Stores until Social Review)



b. Add stores as necessary and set the Messaging Channel Location ID. The Store Code value will be used to map orders to specific stores during order import. See Phase 4 below.



c. Set one of these Podium LocationUids as the “Location Id” field in the Communication Setup from Phase 2 setup above. This Location ID will be used for any order that does not map to a specific store or if the store does not have a location ID configured.



Note: If Store Code is not included in an order, it will be considered the Location ID that has set up in Communication Setup

Phase 4: Order Import

- To match an order to a store use the Additional Field “store_code” (Store code). This is the same field used to map stores for the social review feature.

  Warning: This is an Additional Field, NOT the Order line item field “store_code” used for Store Stop routing.

- The Storis integration already sends over the store_code additional field.

Phase 5: Activate Podium Integration

- An admin for the DT business must activate the integration using the Admin / Podium Activation link. This will go through the OAuth 2.0 process. They will be redirected to Podium where they will need to log in and then be redirected back to complete the activation. This process internally creates an OAuth token that we store and use for API calls to Podium.
